

Coriolis flowmeter

The Coriolis flowmeter is the best solution available for a more accurate and uncomplicated measurement of fuel flow. This will enhance the regulation of the burner fuel and/or precise measurement of fuel usage. The data output can be linked to the vessel's fuel summarising system if it is available.

A Coriolis flowmeter can replace the already installed mechanical flowmeters and provide:

- Maximum uptime
- Increased process reliability
- Low to no maintenance required
- Reduced risk of port penalties when performance is low
